

## Installing Wordpress on Hippiie Hosting

1. Once your domain is resolving properly to Hippiie Hosting's servers, you will be able to access your panel at <http://yourdomain.com:8443>. You can also login from the [Client Login](#) link on the homepage of Hippiie Hosting (<http://hippiehosting.org>).
2. Once you are logged in you are greeted with the home screen of the Plesk Panel, the software that runs your web hosting. The first thing we want to do is install a fresh copy of Wordpress here, and luckily Plesk makes that easy to do. Select **Install Applications** from the link in the righthand sidebar.

3. Near the top of the list you'll find Wordpress. Go ahead and click **Install** underneath the description.

4. On the next screen you'll need to accept the terms and conditions of the software and then click **Next**.

- For the location of the install Plesk creates a subfolder underneath your main domain called "wordpress" but if you'd like to install Wordpress at the root of your site (ie. **yourdomain.com** instead of **yourdomain.com/wordpress**) just remove everything from that field.

By default Plesk will let you use your Hippiie Hosting account information as the login information for your Wordpress admin dashboard (That way you don't have to remember a different userid/password for each). You can choose to keep this or select a separate username and password for the Wordpress install on this screen. When you are done click **Install**.

- The install should only take a few moments to complete and when you are done you will be greeted with a summary page of information about your install, including a link to the Administrative Interface for

The screenshot shows the Hippie Hosting control panel interface. At the top, it displays the user's name 'Subscriber Tim Owens' and the subscription details 'Subscription hippiehosting.org'. There is a search bar and a 'Powered by Parallels' logo. The navigation menu includes 'Home', 'Users', 'Websites & Domains', 'Mail', 'Applications' (highlighted), 'Statistics', and 'Account'. The main content area is titled 'Wordpress Instance' and features an 'Up Level' link. A green information box states: 'Information: WordPress was successfully installed at http://support.hippiehosting.org/wordpress.' Below this, a text block explains that users can manage the app, change settings, or remove it. A toolbar contains 'About', 'Change Settings', and 'Remove' buttons. The configuration is divided into three sections: 'General', 'Administrative access entry points', and 'Public access entry points'. The 'General' section lists 'Installed at' as '/wordpress', 'Administrator' as 'Tim Owens', 'Administrator's email' as 'genial@gmail.com', 'Administrator's login' as 'timmermyboy', 'Interface language' as 'en-US', and 'Site name' as 'My CMS'. The 'Administrative access entry points' section includes links for 'Administrative interface', 'Upload theme', and 'Upload plugin'. The 'Public access entry points' section includes a link for 'Blog'.

General		Administrative access entry points
Installed at	/wordpress	<a href="#">Administrative interface</a>
Administrator	<a href="#">Tim Owens</a>	<a href="#">Upload theme</a>
		<a href="#">Upload plugin</a>
Settings		Public access entry points
Administrator's email	genial@gmail.com	<a href="#">Blog</a>
Administrator's login	timmermyboy	
Interface language	en-US	
Site name	My CMS	

## WordPress

7. Click on The Administrative Interface and login with the credentials you decided on in Step #5. Now you're ready to start adding posts to your site!
